## NEW SMOKE ASPIRATING SYSTEM IN ROVATO

- 18 September 2020

To improve the air quality, we have recently completed the installation of a new smoke aspirating system in our Rovato premises, which is much more powerful and performing than the previous one. It extracts the oily fumes released during the machining process of raw materials, especially in the phase of chip removal (brass, ecobrass, steel etc).

The contract was awarded to Coral Engineering and we are grateful for their excellent job.

Environmental sustainability is a crucial element of our company's mission. We focus on the prevention and reduction of any possible negative effects on nature and are thus performing permanent and careful monitoring of the atmospheric pollution and steadily implementing the best technologies in terms of cutting-edge equipment ... because the environment is our well-respected companion.
